SALES PERFORMANCE TRACKER

Power BI Portfolio Project

Prepared by: Himanshu
Independent learning and portfolio project

Executive dashboard preview captured from Power BI Desktop.

1. Project overview

Sales Performance Tracker is a multi-page Power BI report designed to explore sales performance, customer information, website sessions, product performance and geographic context. The project was developed independently as a learning and portfolio exercise using Power BI Desktop, Power Query and DAX.

Project profile

Attribute	Details
Author	Himanshu
Project type	Independent learning and portfolio project
Tools	Power BI Desktop, Power Query, DAX, CSV
Currency displayed	USD
Date range shown on CEO dashboard	1 January 2024 – 31 December 2025
Report pages	9

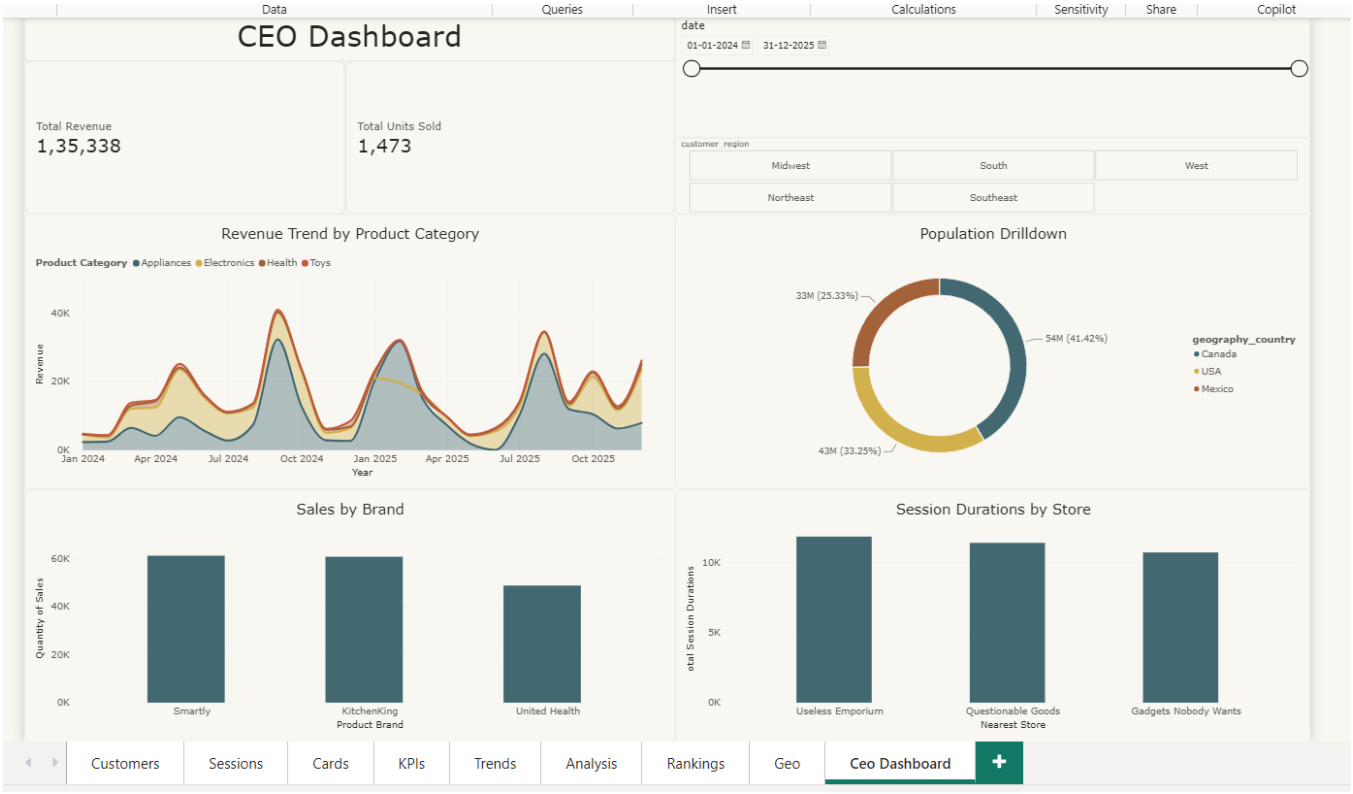

Project objectives

• Explore sales performance over time and across product categories and brands.
• Review customer and website-session information.
• Present KPI, trend, analysis and ranking views.
• Enable interactive exploration through slicers, drill-down and cross-filtering.

2. Report contents

Page	Focus
Customers	Customer analysis
Sessions	Website-session analysis
Cards	Card-based KPI view
KPIs	Performance indicators
Trends	Time-based trends
Analysis	Detailed analysis
Rankings	Comparative rankings
Geo	Geographic analysis
CEO Dashboard	Executive overview

3. Dashboard overview

The supplied CEO Dashboard screenshot shows total revenue of $135,338 and total units sold of 1,473 in the captured filter state. It also includes a date-range slicer, customer-region selector, revenue trend by product category, population breakdown, sales by brand and session durations by store. KPI values may change when filters are changed.

4. Data sources

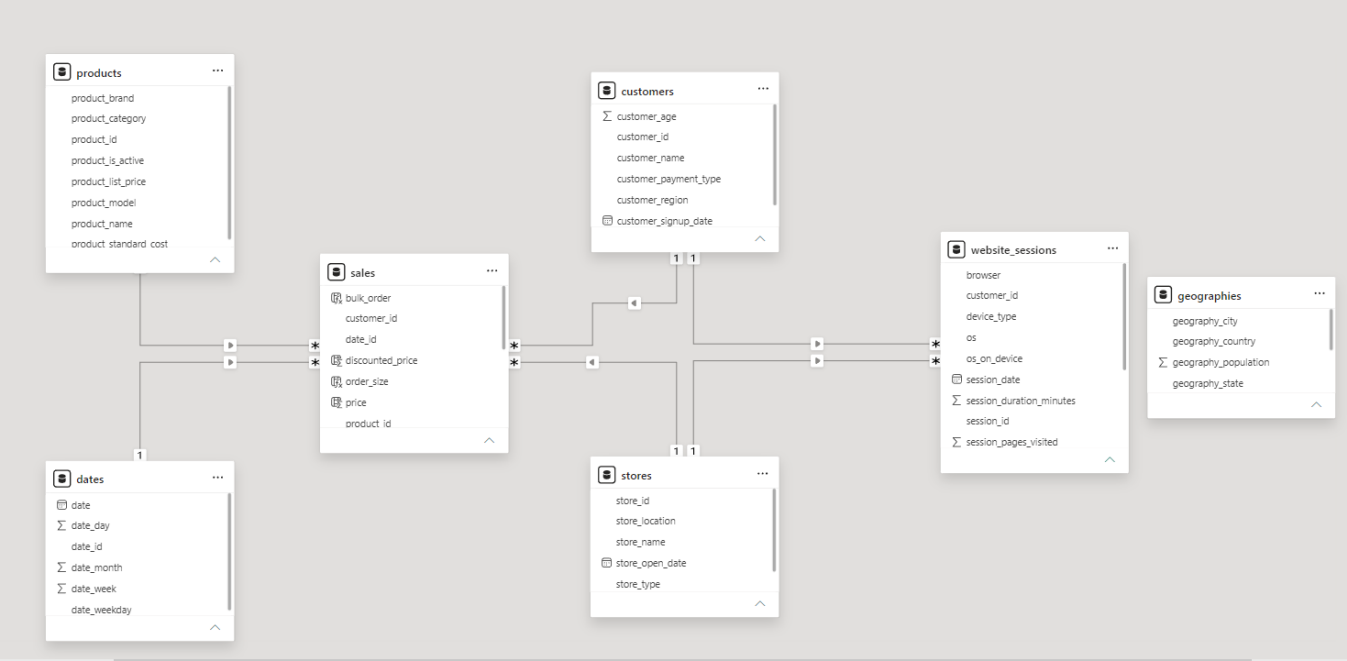

CSV file	Contents
sales.csv	Sales transaction keys, quantity and discount
products.csv	Product, category, brand, pricing and active status
customers.csv	Customer demographics, payment type, region and signup date
dates.csv	Date dimension (731 date rows)
stores.csv	Store name, type, location and opening date
website_sessions.csv	Session date, customer/store, device/browser, purchase, duration and engagement fields
geographies.csv	Country, state, city and population

Learning reference: YouTube video reference supplied by the author. The project is presented as an independent learning/portfolio implementation. The video title and channel name have not been independently verified.

5. Data preparation and modelling

The author reports using Power Query to change data types, remove duplicates and handle missing values. The author also reports creating a separate Date table and using DAX measures and calculated columns.

The semantic model includes seven tables: sales, products, customers, dates, stores, website_sessions and geographies. The relationship definitions show sales linked to products, customers, dates and stores; website_sessions linked to customers and stores. No relationship is defined for geographies in the supplied model, so it is disconnected in the current model.

Data model screenshot supplied by the author.

6. DAX implementation

The semantic model extraction identified nine explicit measures and four calculated columns. The separate DAX_Measures.md file contains the formulas, descriptions and review notes. The documented DAX concepts include SUM, MIN, AVERAGE, SUMX, AVERAGEX, CALCULATE, DATE, RELATED, IF, SWITCH and INT.

7. Interactivity

The author identified slicers, drill-down and cross-filtering as implemented report interactions.

8. Validation notes and next steps

Business findings: No quantified findings were provided. Add findings only after checking actual visual results under a stated filter context.

Revenue measure review: The discounted_price calculated column already includes quantity × list price × (1 – discount). The discounted_revenue measure multiplies this by quantity again. Confirm whether this is intentional. The CEO Dashboard revenue KPI uses total_revenue.

Bulk order data type: The bulk_order expression returns text values “True” and “False”, while model metadata marks the column as Boolean. Verify consistency in Power BI Desktop.

Fixed February measure: revenue_in_feb is hard-coded to February 2025; it is not a dynamic month-selection measure.

Source paths: Update local absolute CSV paths in Power Query so the project can be refreshed by someone downloading the repository.

Dataset rights and privacy: Confirm the course dataset may be redistributed publicly and that customer-identifying fields are synthetic or safe to publish. Otherwise omit raw CSV files or replace them with a properly licensed anonymized dataset.

9. Suggested repository contents

README.md · Sales_Performance_Tracker_Report.pdf · DAX/DAX_Measures.md · Dashboard project files · Dataset CSV files (only if redistribution is permitted) · Screenshots/Main_Dashboard.png · Documentation/Data_Model.png
